

## Filter Activity Log – find result values that are not mapped

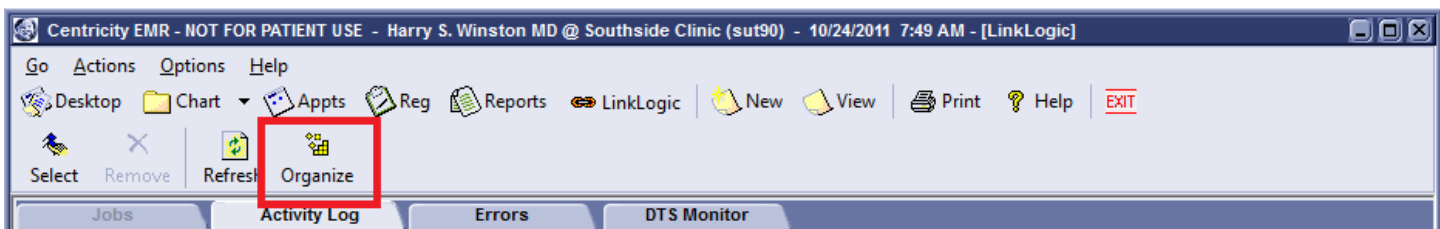

It is important to note that the Centricity Activity Log is simply a notification of “activity” occurring in LinkLogic; the **notifications should NOT be treated like errors**; there is an Error tab that should be monitored for errors.

One potentially common code in the Activity Log is 4118. This code lets us know that the result value coming back from the lab is not mapped in the Cross Reference file. Therefore, the result will not appear in the flowsheet, and your practice will not be able to perform reporting on that particular value. Below we show you how to filter this code and get a better understanding of how many values are not mapped in your Cross Reference file.

- 1) In Centricity, access Administration > Activity Log:

- 2) Click “Organize”:

- 3) Use the Message code range “Min” and “Max” to type in code 4118.
